# BEECH wood

## European beech *Fagus sylvatica*

The European Beech or Common Beech is a deciduous tree belonging to the beech family. The natural range extends from southern Sweden to central Italy, west to France, southern England, northern Portugal, and central Spain, and east to northwest Turkey. By Poland, runs north-eastern limit range.

It is a large tree, capable of reaching heights of up to 49 m and 3 m trunk diameter. A 10-year-old sapling will stand about 4 m tall. It has a typical lifespan of 150 to 200 years, though sometimes up to 300 years.

The appearance varies according to its habitat; in forest conditions, it tends to have a long, slender light-gray trunk with a narrow crown and erect branches, in isolation with good side light the trunk is short with a large and widely spreading crown with very long branches.

A beech forest is very dark and few species of plant are able to survive there, where the sun barely reaches the ground. Young beeches prefer some shade and may grow poorly in full sunlight

The wood of the European Beech is used in the manufacture of numerous objects and implements. Its fine and short grain makes it an easy wood to work with, varnish and glu. The density of the wood is 720 kg per cubic meter. It is particularly well suited for minor carpentry. The European Beech can do almost anything other than heavy structural support, so long as it is not left outdoors. Its hardness make it ideal for making wooden kitchen utensils, home accessories, toys, ect.
